Verified Dataset Splits and FairForge-2 Fairness Results

CES-FL research reporting snapshot

2 November 2026

Reporting only: existing JSON metrics and CSV split metadata were inspected. No new training, detector inference, calibration, score inversion or test-based tuning was performed. Image counts below are frame/image rows, not videos or unique people. No result establishes that the current counterfactual method beats Ding.

1. Exact current dataset splits

Table 1: Current frozen split sizes; native Ding training/validation/test counts were independently cross-checked.

Dataset	TRAIN	VAL	TEST	Total
Ding FF++	76,139	25,386	25,401	126,926
FairForge-2 public	218,266	31,107	87,564	336,937

Table 2: Class counts in the exact current manifests.

Dataset / split	Images	Real	Fake
Ding FF++ / TRAIN	76,139	12,926	63,213
Ding FF++ / VAL	25,386	4,092	21,294
Ding FF++ / TEST	25,401	4,538	20,863
FairForge-2 public / TRAIN	218,266	16,777	201,489
FairForge-2 public / VAL	31,107	2,438	28,669
FairForge-2 public / TEST	87,564	5,441	82,123

Table 3: Ding-protocol external tests. FF++ supplies training and validation; these domains are test-only in this protocol.

External dataset	TRAIN used here	VAL used here	TEST	Real	Fake
dfdc	–	–	22,857	14,699	8,158
celebdf	–	–	28,458	5,713	22,745

Continued on next page

External dataset	TRAIN used here	VAL used here	TEST	Real	Fake
dfd	–	–	9,385	3,092	6,293

FairForge-2 public is our current release. Historical internal/full builds and a legacy 57,665-image FF2 evaluation subset are different inventories, retained separately below. Exact paths and SHA256 values are in SPLITS.json. Frame membership matching does not establish true-person/donor disjointness; the Ding benchmark has disclosed contributor overlap.

2. FairForge-2 public in-domain validation: current CES-FL pretraining

Table 4: Original-only BCE pretraining on public TRAIN; evaluation and selection on public VAL, not TEST.

Model / seed	Epochs	Selected epoch	VAL images	AUC (%)	FPR (%)	FNR (%)	Logit threshold
CES-FL P / 17	10	9	31,107	99.8105	9.9672	0.3802	-4.2040

Calibration uses this model's VAL real images only: requested FPR 10%, achieved 243/2438 = 9.967186%. No TEST result exists for this new in-domain model. It used no counterfactual or fairness training loss; the fairness numbers are measured evaluation outcomes, not proof of a fairness improvement.

Table 5: Current in-domain validation fairness across every recorded axis.

Axis	Eligible groups	F_{FPR} (%)	F_{DP} (%)	*es*-AUC (%)	FPR gap (pp)	FNR gap (pp)	Worst AUC (%)
Gender	2	3.5980	0.2438	99.8024	3.5980	0.1180	99.8080
Race	4	12.1565	1.0574	99.4374	7.5679	0.1260	99.6840
Gender x race	8	28.3857	1.5308	99.0752	11.8517	0.2848	99.5827
Age bins	4	9.2329	4.3313	99.6311	7.4848	0.1737	99.6982
Skin bins (ITA)	4	11.6827	0.4047	99.6213	7.9134	0.2700	99.6977
Native ids8	8	34.8666	2.8386	98.9305	18.1073	0.5583	99.5209

F_FPR = 100 times the sum of absolute group FPR deviations from the pooled FPR. F_DP is 100 times the max-min positive-rate gap. FPR/FNR gaps are percentage-point max-min differences. All AUCs and rates are displayed as percentages. F_FPR is not a false-positive rate and its scale depends on the number of groups. Age and skin bins are automated proxies, not newly human-reviewed ground truth. Native ids8 is kept as its own grouping; it is not assumed interchangeable with gender x race. Eligible aggregates require at least20real and20fake frames per group; unknown groups remain visible in detailed support tables.

3. FairForge-2 public TEST: FF++-trained CES-FL transfer results

All five models below were trained on FF++, not FairForge-2. Their ten-epoch downstream runs used the existing shared ten-epoch FF++ detection-pretrained encoder. Seed17. R0=frozen BCE; R1=partial BCE; R2=partial group-DRO; RN=no-change diagnostic; RD=age-edit diagnostic. RN/RD use only six reviewed sources and do not establish broad demographic or forensic-selectivity validity. The frozen global threshold comes from FF++ VAL; it was never calibrated on FairForge-2.

Table 6: Existing public held-out transfer measurements at each stored FF++ validation threshold.

Arm	TEST images	AUC (%)	FPR (%)	FNR (%)	G×R F_{FPR} (%)	G×R FPR gap (pp)	G×R worst AUC (%)
R0	87,564	41.6819	57.1402	56.8428	73.9917	26.6485	39.4477
R1	87,564	41.8710	59.5663	52.5468	73.9710	28.4375	39.4298
R2	87,564	42.8294	60.2463	51.5556	79.0243	29.0497	39.9600
RN	87,564	38.8312	59.0700	56.6394	75.9691	28.2139	36.5254
RD	87,564	39.5290	58.2981	58.0434	75.2938	29.0560	37.2655

Transfer detection is weak: these AUCs are below50%. Values were not inverted or hidden. They cannot be compared with the99.8105% in-domain VAL score as if they measured the same experiment.

Table 7: All six fairness axes for public TEST transfer: Stored FF++ validation threshold.

Arm	Axis	Eligible groups	F_{FPR} (%)	F_{DP} (%)	*es*-AUC (%)	FPR gap (pp)	FNR gap (pp)	Worst AUC (%)

4. Historical CFES-D: public FairForge-2 in-domain TEST

Historical CLIP ViT-L/14 CFES-D, seed7, is a different model/configuration from current Xception CES-FL. Public TRAIN lineage is recorded. The full TEST report has87,564images; its leakfree-video companion has the same n and AUC and is not counted as another independent experiment. Age/skin-axis exports were not found in these legacy reports. Threshold conventions differ from current CES-FL, so these rows are contextual records, not matched superiority comparisons.

Table 9: Historical public-test CFES-D detection at all located operating modes; FNR is the arithmetic complement of stored TPR.

Stored operating mode	AUC (%)	FPR (%)	FNR (%)	Threshold
Native probability0.5	98.2598	0.0919	14.3650	0.5
Stored VAL threshold	98.2598	0.0735	15.3745	0.5040
Legacy VAL-intercept calibration	98.2598	3.0693	6.6206	0.5 after intercept

Table 10: Historical CFES-D fairness exports. Native aggregate entries already use percentage units; they were not multiplied by100 again. Blank entries were not exported.

Operating mode	Axis	F_{FPR} (%)	F_{DP} (%)	*es*-AUC (%)	FPR gap (pp)	FNR gap (pp)	Worst AUC (%)
Native0.5	gender	0.0004	3.4465	97.5948	0.0004	4.0651	97.8816
Native0.5	race	0.2747	8.6095	95.7898	0.1887	11.5783	97.5091
Native0.5	intersection	1.1345	10.8742	92.9560	0.4454	14.4908	97.0439
Stored VAL	gender	0.0303	3.4236	97.5948	0.0303	4.0382	97.8816
Stored VAL	race	0.2029	8.7345	95.7898	0.1708	11.6876	97.5091
Stored VAL	intersection	0.9268	12.1464	92.9560	0.4454	15.8115	97.0439
VAL-intercept	gender	0.1552	2.3790	97.5948	–	–	–
VAL-intercept	race	3.9215	3.4274	95.7898	–	–	–
VAL-intercept	intersection	8.3146	4.7137	92.9560	–	–	–

Legacy common-intercept calibration reports b=58.04658725, objective: class-balanced validation log loss, common intercept. This stored calibration was not re-fit here. The operating-point trade-off is visible in FPR and FNR; a tiny F_FPR at a conservative cutoff does not by itself establish strong detection.

5. Archived Ding FF2 references: different evaluation inventories

The archived FF++-trained Ding exports below use either a57,665-row legacy subset or the182,884-row historical internal/full FF2 test. Neither is the current87,564-row public TEST. These native metrics are retained separately. Their original operating/eligibility conventions were not redefined or recalibrated here. Full-stage archive GDA has the documented detached-fairness gradient defect and is not certified as the paper-trained differentiable method. The epoch25 and epoch49 exports are both retained; no test-best checkpoint is selected.

Table 11: Previously calculated Ding transfer fairness; distinct legacy FF2 inventories, not current public in-domain results.

Table 12: Ding trained on the historical larger FF2 build: AUC-only records. No new raw-score evaluation was performed.

Historical in-domain model	Internal TEST images	AUC (%)	Fairness export in reused record
Ding classification	182,884	99.2619	–
Ding archived SFD+GDA	182,884	99.3573	–

That historical internal build records502,035TRAIN /74,974VAL /182,884TEST images. These counts and AUC-only values come from the existing baseline evidence record, not the current public split. A matched Ding model trained and evaluated on the current public split remains unavailable in this inspected record. Do not replace that missing row with internal-build or transfer results.

6. Detailed public demographic group support and errors

The following rows retain every recorded group, including unknown/ineligible groups. AUC is undefined for a group lacking either class. Eligibility is the source report status, not a demographic-truth guarantee. All percentages use the stored global operating point; no group-specific threshold was introduced.

Table 13: All available group-wise metrics: current public VAL and both stored transfer TEST operating modes. ModelP17 means in-domain VAL; R0/R1/R2/RN/RD mean FF++-trained TEST transfer.

Model	Operating mode	Axis	Group	Real n	Fake n	AUC (%)	FPR (%)	FNR (%)	Eligible

7. Previously calculated transfer confidence intervals

These are the existing1000-replicate percentile intervals over recorded connected-contributor components, conditional on seed17 and frozen thresholds/checkpoints. They do not measure training-seed variability, paired method differences, hidden-donor uncertainty or label uncertainty. Undefined replicates were omitted by the original calculation; valid counts are shown.

No confidence intervals were newly calculated for in-domain P17 or historical CFES-D here. The transfer intervals below apply only to the stored validation-calibrated operating point, not the separate fixed0.5 report.

Table 14: All stored transfer uncertainty intervals. AUC/rates are percent; gap intervals are percentage points; F_FPR/F_DP follow the percentage-scaled metric definitions above.

8. Source records and remaining missing results

There are no trained results for the new three-seed CDF/complete-DRO matrix, no full validated manipulation-response training result, and no public TEST score for the current FF2 P17 run. Missing values mean unavailable or undefined, never zero. This export does not authorize training, generation or held-out evaluation. Further FairForge-2 experiments remain held.

The current models, historical models, thresholds, group labels, training sets and evaluation roles differ. Report each block with its own protocol. Do not rank the mixed blocks as an apples-to-apples model comparison. Full machine-readable snapshots, native source hashes, normalized axis/group CSVs and exact split manifests accompany this standalone TeX file.
